MUSIFY MOTION SYSTEM

Interactive Brand Identity & Motion Design

STUDENT: MOHAMMAD HILAL MALIK

NOVEMBER 2025

COURSE 2130

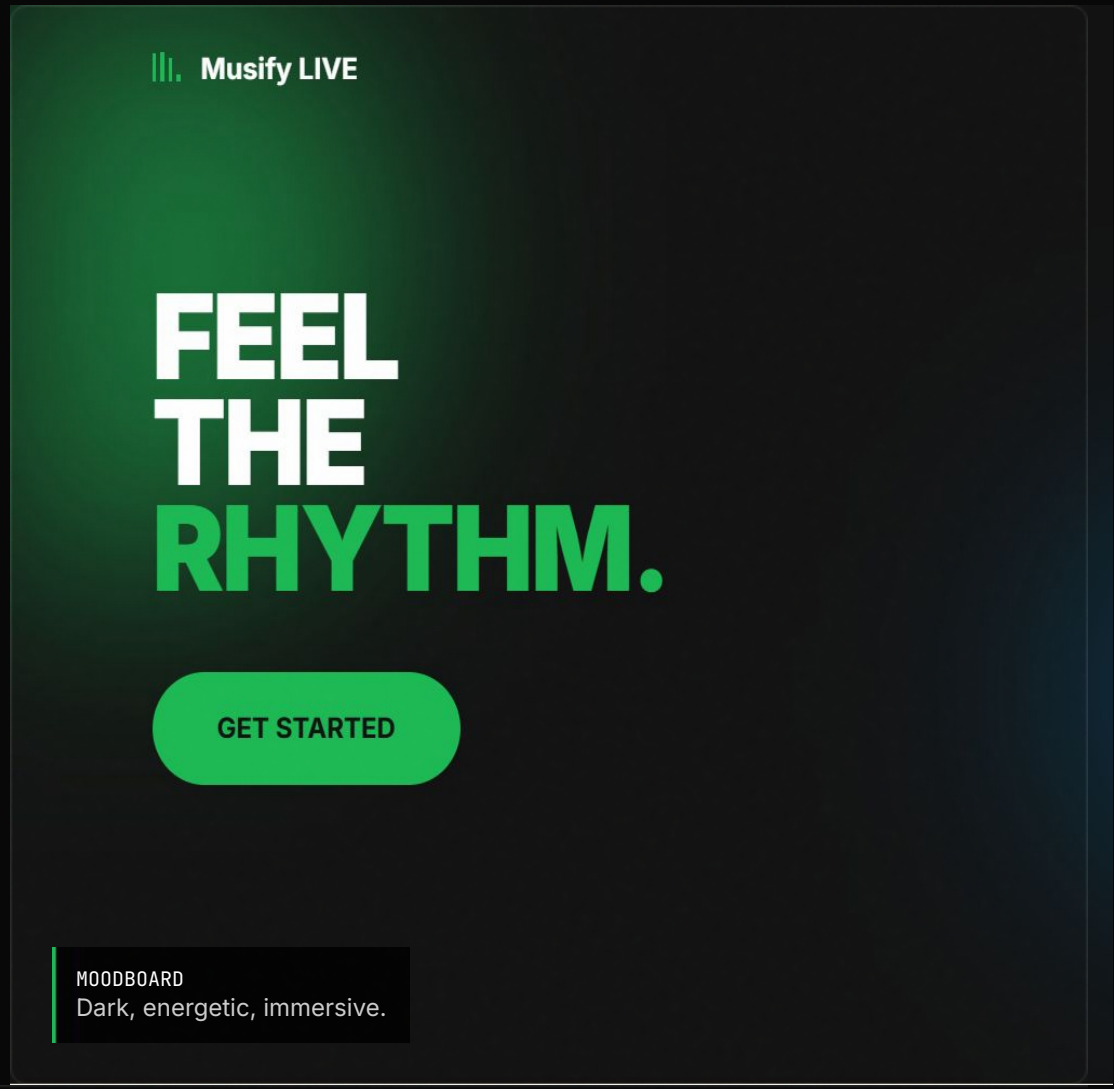

CORE CONCEPT

The "Live Stage" Metaphor

Musify is a music event platform, not just a streaming service. The design mimics the lighting and atmosphere of a live venue.

VISUAL LANGUAGE

- **Dark Mode Default:** Prioritizes content (Album Art) with focus.
- **Neon Accents:** Uses #1DB954 for primary actions, simulating laser lights.
- **Inter Typeface:** Clean, grotesque sans-serif for legibility in dark mode

MOODBOARD
Dark, energetic, immersive.

The Motion Recipe

To ensure consistency, all animations follow three core rules derived from the brand's personality.

1. Staggered Entry

The "Soundcheck"

Elements never appear simultaneously. We use GSAP staggers (0.1s - 0.2s) to guide the eye hierarchically, building anticipation like a band tuning up.

```
stagger: { each: 0.1 }
```

2. Heavy Physics

The "Tactile" Feel

Motion should feel like it has mass. We use "Elastic" and "Back" easings instead of linear fades to give buttons and cards a physical presence.

```
ease: "back.out(1.7)"
```

3. Ambient Life

The "Crowd" Energy

The UI is never dead. Background Orbs and Audio Visualizers loop continuously, keeping the interface alive even when the user is idle.

```
repeat: -1, yoyo: true
```

UX CONCERN: FOCUS

The Curtain Reveal

Problem: Single Page Apps often flash unstyled content or blank white screens while loading assets, breaking immersion.

Solution: A custom preloader that mimics a stage curtain. The bars animate to confirm system activity ("Tuning In..."), then the entire overlay slides UP heavily.

```
t .to(".preloader", {
l yPercent: -100,
  duration: 1.2,
  ease: "power4.inOut
});      "
```

TUNING IN...

UX CONCERN: AFFORDANCE

The Magnetic Button

Theory (Fitts's Law): Increasing the effective target size of a button improves usability.

Solution: The button physically "sticks" to the cursor when it gets close. This playful resistance confirms the element is interactive before the user even clicks, adding a tactile layer to a flat screen.

```
const x = (e.clientX - centerX) * 0.3;
gsap.to(btn, { x: x, y: y });
```

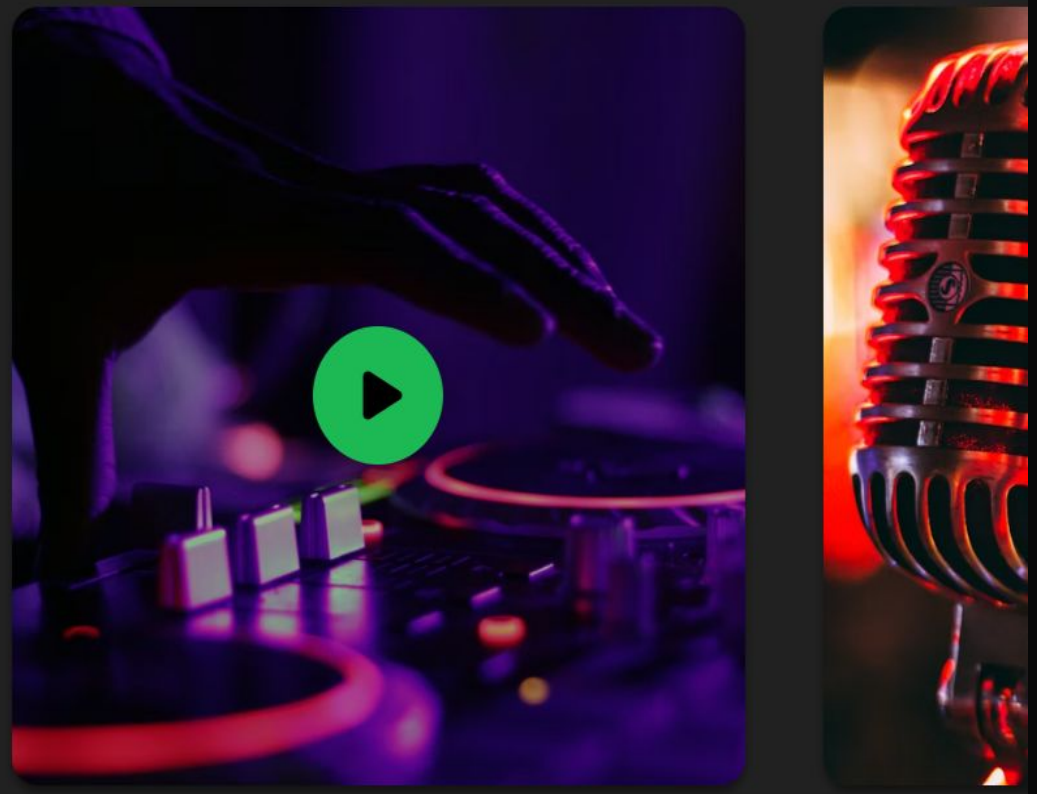

UX CONCERN: COGNITIVE LOAD

Transformative Scrolling

Problem: Infinite vertical feeds cause "scroll fatigue." Users stop seeing individual items and just scan patterns.

Solution: We convert vertical scroll energy into horizontal movement for the "Discovery" section. This breaks the pattern, forcing the user to slow down and view event flyers as if flipping through vinyl records.

- ✓ **Sticky Positioning:** Holds the viewport.
- ✓ **Math:** Translates Y-axis delta to X-axis.

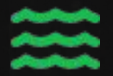

GSAP Core

The engine behind the timelines. Used for the robust "Master Timeline" that handles the preloader-to-hero sequencing.

ScrollTrigger

Connects animations to the scrollbar. Used for the Parallax effects on the artist cards.

Lenis.js

Standard browser scrolling is choppy. Lenis interpolates scroll data for a "Luxury" fluid feel.

07 / END

THANK YOU !
